Customer Reviews
This guidebook is an essential reference for teachers, parents, and anyone who deals with kids on a regular basis. The prevalence of ADD diagnoses should lead us all to question what the bigger picture is. Allergy problems are one of the most important consequences of our modern world. This guidebook is designed to help laypeople spot allergies in kids, especially the kids who act up. It's a shame to drug kids with Ritalin when dietary or environmental changes can give better results without turning children into zombies. To ignore the accomplishments of Environmental Medicine would be foolish. There is a lot of detail packed into this small book to help parents and teachers understand food, environmental, and chemical allergies, and to spot them on their own. Helpful advice is provided for different diets that can reveal a lot about a troubled child's behavior. Diagnostic diets (elimination diets) are detailed as well as rotation diets to minimize food reactions. Descriptions of children's allergic responses are detailed and accurate, making it easier for you to know how to spot allergies in kids. Though this low-budget publication is written by a doctor and not a writer, it is not overly technical in style. The writing is to-the-point, a how-to manual for your potentially allergic kid, full of suggestions, case studies, and references. Dr. Rapp is an expert in the
field of pediatric environmental medicine in the tradition of Theron Randolph MD, and her experience is apparent. Though I know there are better treatments than extracts for allergies (her recommendation, in addition to dietary and/or environmental changes), it is still a vast improvement over drugs and allergy shots.
